

How can we tackle inequity in the transition?

EIP061

28 February 2023

Problem

- Discontinuities like the energy system transition favour those with the capital, knowledge or connections to survive and profit from the change.
- This will disadvantage the majority of the population who do not have access to the resources to participate beneficially in the energy system transition (EST).
- Identification of new technologies and new systems of technologies and new ways of working are required to address physical inequity.
- Identification of new funding methods and commercial offerings are required to address this physical inequity.
- Solutions must not hinder energy system resilience or net zero roll-out.

Key Questions

- What new technical solutions will address heating and energy production & storage for those where the present technical resources do not match the requirement? (eg no room for heat pumps of any sort)?
- What new financial solutions (including funding access to technologies) will address energy needs for those where the present financial resources do not match the requirement?
- What technical solutions might reduce the overall energy costs?
