

NIA Project Registration and PEA Document

Date of Submission

Jun 2017

Project Reference

NIA_NGET0208

Project Registration

Project Title

EPRI Research Collaboration on Electric & Magnetic Fields Health & Safety (P60) 2017 -2021

Project Reference

NIA_NGET0208

Project Licensee(s)

National Grid Electricity Transmission

Project Start

January 2017

Project Duration

4 years and 4 months

Nominated Project Contact(s)

John Swanson

Project Budget

£12,200,000.00

Summary

The nature of the programme is that almost all of the individual strands take more than a single year to complete, and therefore not all the component strands are expected to report specific milestones in 2017. Among the key expected areas of progress in 2017 are:

- completion of the California Power Line Study with publication of the magnetic-field results, which uses California birth and cancer registry data and innovative GIS techniques to examine childhood leukemia incidence as relates to residential distance from transmission lines (the distance findings were published in 2016)
- analysis of pooled data on childhood leukemia and distance from power lines (will include data from the California Power Line Study as well as UK data). Analysis and drafting of paper expected in 2017.
- progress on reaching international consensus on the best way to progress leukemia mouse model experiments to determine whether exposure to magnetic fields affects disease development using appropriate genetic models
- facilitating in individual countries of large scale, international epidemiologic study (TransExpo) aimed at reducing selection bias and thereby providing an alternative perspective to existing studies which are known to be prone to bias
- assessment of the relationship of magnetic field exposure and personal mobility with miscarriages in subjects treated at an assisted reproductive technology clinic
- further investigation of potential EMF/RF interference with active implanted medical devices (such as, pace makers and defibrillators). Publication of results obtained in program to date and assessment of future needs.

- completion of EMAlert - a personal monitor that informs workers of the presence of fields that may possibly disrupt an implanted pacemaker or defibrillator
- additional research on magnetophosphene thresholds in human subjects

Problem Being Solved

National Grid recognises that there are parallel challenges within the field of electricity transmission globally which are more economically investigated and addressed through collaborative learning and knowledge generation among key industry stakeholders. The Electric Power Research Institution (EPRI), with its wide international membership, plays a valuable role in identifying and delivering innovation projects aimed at addressing many of the challenges faced by electricity industry participants, including Transmission Network Owners and System Operators.

This portfolio of work is focused on research into the effects of Electric and Magnetic Fields (EMF) and seeks to address key aspects of National Grid's Innovation Strategy and an area of particular interest and concern to customers and other stakeholders with an interest in, or affected by, electricity transmission infrastructure.

New transmission and distribution construction (including the development of electric vehicle charging infrastructure), capacity upgrades, scientific reports and the publicity surrounding them, can create public concerns about possible human health risks from EMF exposures. Such concerns can lead to lengthy delays for new projects, and possibly cause regulatory decisions that affect project schedules and costs, and jeopardise public acceptability of existing infrastructure. Revisions to guidelines for public and worker EMF exposures could result in altered exposure limits with consequential constraints on operations and extra costs.

Method(s)

EPRI is a non-profit organisation which facilitates a variety of research projects relating to electricity transmission networks. These collaborative projects bring together scientists, engineers and academic experts in the industry to help assess recognised challenges within the field. EPRI's approach in managing collaborative projects is beneficial to National Grid and our customers, providing valuable information, learning and knowledge which would be more expensive to formulate on an individual basis.

By participating in a given project, National Grid not only contributes resource to the work and receives results, but is also able to influence the detailed content and priorities of the project, through attendance at steering groups (known as "Area Councils").

Associated with this programme are the following research projects. The project is organised in formal terms as four sub-projects:

- EMF and radio frequency (RF) exposure assessment related to emerging technologies
- EMF and RF information project
- Health studies related to EMF from transmission and distribution infrastructure
- EMF and RF occupational health

Scope

The nature of the programme is that almost all of the individual strands take more than a single year to complete, and therefore not all the component strands are expected to report specific milestones in 2017. Among the key expected areas of progress in 2017 are:

- completion of the California Power Line Study with publication of the magnetic-field results, which uses California birth and cancer registry data and innovative GIS techniques to examine childhood leukemia incidence as relates to residential distance from transmission lines (the distance findings were published in 2016)
- analysis of pooled data on childhood leukemia and distance from power lines (will include data from the California Power Line Study as well as UK data). Analysis and drafting of paper expected in 2017.
- progress on reaching international consensus on the best way to progress leukemia mouse model experiments to determine whether exposure to magnetic fields affects disease development using appropriate genetic models
- facilitating in individual countries of large scale, international epidemiologic study (TransExpo) aimed at reducing selection bias and thereby providing an alternative perspective to existing studies which are known to be prone to bias
- assessment of the relationship of magnetic field exposure and personal mobility with miscarriages in subjects treated at an assisted reproductive technology clinic
- further investigation of potential EMF/RF interference with active implanted medical devices (such as, pace makers and

defibrillators). Publication of results obtained in program to date and assessment of future needs.

- completion of EMAlert - a personal monitor that informs workers of the presence of fields that may possibly disrupt an implanted pacemaker or defibrillator
- additional research on magnetophosphene thresholds in human subjects

Objective(s)

The purpose of the EMF and RF Health Assessment and Safety EPRI programme is to continue to provide the following updated outputs:

- timely, reliable EMF and RF scientific research results, communication materials, relevant background information, and analysis of key external studies;
- publicly accessible, up-to-date information on EMF and RF research, health risk evaluations, and regulatory actions;
- experimental and epidemiologic research investigating high-priority residential and occupational EMF and RF health and safety questions;
- EMF workstation software for modelling transmission and distribution infrastructure EMF in residential and occupational settings;
- EMF and RF exposure characterisation research and exposure assessment software;
- educational materials, including instructional EMF/RF DVDs, tutorials, and RF safety awareness training;
- comprehensive assessment of the potential effects of EMF on aquatic life from submerged cables; and
- investigation of potential EMF interaction with implanted medical devices

Consumer Vulnerability Impact Assessment (RIIO-2 Projects Only)

n/a

Success Criteria

As already described, the overall project comprises multiple strands of work. Progress should be expected on each strand during 2017, but not necessarily that each strand would be completed or produce significant publications. The success criteria are that most of the milestones listed under Scope above should be achieved.

Project Partners and External Funding

n/a

Potential for New Learning

n/a

Scale of Project

The EMF and RF programme is predominantly laboratory or desk based; as such there is no scope to reduce the scale of the project any further. Much of the value of the programme comes from its scale which includes funding from other utilities, allowing it to be run as a coordinated programme rather than a series of stand-alone projects.

Technology Readiness at Start

TRL2 Invention and Research

Technology Readiness at End

TRL4 Bench Scale Research

Geographical Area

The research undertaken in the EPRI EMF programme is predominantly carried out in the US, Canada, and various European countries, although the programme also reviews the latest research from across the world.

Revenue Allowed for the RIIO Settlement

None

Indicative Total NIA Project Expenditure

The total indicative NIA expenditure is £1.6m for the period 2017 to 2021.

Project Eligibility Assessment Part 1

There are slightly differing requirements for RIIO-1 and RIIO-2 NIA projects. This is noted in each case, with the requirement numbers listed for both where they differ (shown as RIIO-2 / RIIO-1).

Requirement 1

Facilitate the energy system transition and/or benefit consumers in vulnerable situations (Please complete sections 3.1.1 and 3.1.2 for RIIO-2 projects only)

Please answer **at least one** of the following:

How the Project has the potential to facilitate the energy system transition:

n/a

How the Project has potential to benefit consumer in vulnerable situations:

n/a

Requirement 2 / 2b

Has the potential to deliver net benefits to consumers

Project must have the potential to deliver a Solution that delivers a net benefit to consumers of the Gas Transporter and/or Electricity Transmission or Electricity Distribution licensee, as the context requires. This could include delivering a Solution at a lower cost than the most efficient Method currently in use on the GB Gas Transportation System, the Gas Transporter's and/or Electricity Transmission or Electricity Distribution licensee's network, or wider benefits, such as social or environmental.

Please provide an estimate of the saving if the Problem is solved (RIIO-1 projects only)

Each project will have different financial savings based on the outcomes and potential benefits gained. Each EPRI programme that National Grid joins has been through two stages of review that consider the potential to deliver financial benefits. In the first instance, within EPRI's governance, the Research Advisory Committee provides guidance on policies and issues that impact the power industry to inform the content of the research programmes. Within National Grid, the technical lead for each aspect of the GB Transmission Network undertakes a review of the proposed EPRI programme relevant to their technical expertise and responsibilities and evaluates which provide potential value from a GB perspective as part of an annual review of which programmes to participate in.

The EMF programme provides key learning and accurate information which can be used by National Grid to help assess the health impact of EMF and identify any future strategies or procedural developments.

Please provide a calculation of the expected benefits the Solution

Not required for research projects.

Please provide an estimate of how replicable the Method is across GB

Electric and magnetic fields will be present at any existing or newly built overhead lines, underground cables or substations throughout the transmission and distribution networks.

Please provide an outline of the costs of rolling out the Method across GB.

The direct cost of making a policy or procedure change following significant EMF research could range from as little as ten thousand to hundreds of thousands of pounds depending on the complexity of the change implications. The wider cost implications arising from such changes will be dependent on the specific outcomes generated from the project and typically will be subject to further stages of demonstration prior to roll out. Further information regarding roll out costs can be provided prior to demonstration stage.

Requirement 3 / 1

Involve Research, Development or Demonstration

A RIIO-1 NIA Project must have the potential to have a Direct Impact on a Network Licensee's network or the operations of the System Operator and involve the Research, Development, or Demonstration of at least one of the following (please tick which applies):

- A specific piece of new (i.e. unproven in GB, or where a method has been trialled outside GB the Network Licensee must justify repeating it as part of a project) equipment (including control and communications system software).
- A specific novel arrangement or application of existing licensee equipment (including control and/or communications systems and/or software)
- A specific novel operational practice directly related to the operation of the Network Licensees system
- A specific novel commercial arrangement

RIIO-2 Projects

- A specific piece of new equipment (including monitoring, control and communications systems and software)
- A specific piece of new technology (including analysis and modelling systems or software), in relation to which the Method is unproven
- A new methodology (including the identification of specific new procedures or techniques used to identify, select, process, and analyse information)
- A specific novel arrangement or application of existing gas transportation, electricity transmission or electricity distribution equipment, technology or methodology
- A specific novel operational practice directly related to the operation of the GB Gas Transportation System, electricity transmission or electricity distribution
- A specific novel commercial arrangement

Specific Requirements 4 / 2a

Please explain how the learning that will be generated could be used by the relevant Network Licensees

In addition to the publication of research outcomes and summary reports described above, every year National Grid and EPRI organise a conference in the United Kingdom to present and disseminate results and outcomes from the project that GB Network Licensees subscribe to. The conference is open to all GB transmission operators and distribution network operators, irrespective of their involvement in the project. Information from each project is made available to all relevant parties to ensure an open environment for learning to be shared. The direct link to EPRI's EMF project website is <http://portfolio.epri.com/ProgramTab.aspx?sid=ENV&rid=254&pId=8047> Industry coordination on EMFs is organised through ENA's EMF Strategy Committee, on which all ENA members are entitled to representation. Network Licensees are alerted to significant learning from this project through the papers for those meetings and an update on research is a standing item on the agenda. National Grid maintains a public-facing website www.emfs.info. This already includes listings of publications from the EPRI EMF Project and further information on some of the research is being progressively added.

Or, please describe what specific challenge identified in the Network Licensee's innovation strategy that is being addressed by the project (RIIO-1 only)

This project fits within the corporate responsibility value area of the Electricity Innovation Strategy.

- Has the Potential to Develop Learning That Can be Applied by all Relevant Network Licensees

Is the default IPR position being applied?

- Yes

Project Eligibility Assessment Part 2

Not lead to unnecessary duplication

A Project must not lead to unnecessary duplication of any other Project, including but not limited to IFI, LCNF, NIA, NIC or SIF projects already registered, being carried out or completed.

Please demonstrate below that no unnecessary duplication will occur as a result of the Project.

n/a

If applicable, justify why you are undertaking a Project similar to those being carried out by any other Network Licensees.

n/a

Additional Governance And Document Upload

Please identify why the project is innovative and has not been tried before

n/a

Relevant Foreground IPR

n/a

Data Access Details

n/a

Please identify why the Network Licensees will not fund the project as apart of it's business and usual activities

n/a

Please identify why the project can only be undertaken with the support of the NIA, including reference to the specific risks(e.g. commercial, technical, operational or regulatory) associated with the project

n/a

This project has been approved by a senior member of staff

Yes
