Developments in Protection and Control

Project Reference Number

Project Licensee(s)

National Grid Electricity Transmission

Project Start

August 2009

Project Duration

3 years and 6 months

Nominated Project Contact(s)

National Grid TO Innovation Team

Project Budget

£685,000.00

Summary

Market driven grid management has increased the number of renewable/distributed generation sources, introduced complexities to address reactive support and progressively stress transmission networks. This has increased the complexity of operation, monitoring, control and protection of large interconnected electric power systems considerably. The penetration of renewable generation is increasing and there are targets set for connection of future renewable sources. At the same time is the asset owner is faced with increasing maintenance and existing asset replacement which will result in reduced circuit availability. These factors will lead to much less predictable operating scenarios and therefore greater dependence on real-time support tools to observe and manage the condition of the network. Specific issues for investigation: Synchronized Measurement Technology (SMT), including Phasor Measurement Units (PMUs) and its applications as an important element and enabler of WAMPAC, voltage instability. Process Bus (IEC61850-9-2) and oscillatory stability.

Problem Being Solved

Method(s)

Scope

Objective(s)

This combined project covers developments on protection and control in three main areas:

To evaluate the technology, functionality, performance, interoperability and application of Phasor Measurement Units (PMUs). This will involve laboratory scenario testing against a system model and pilot deployment on transmission systems in UK and Ireland to baseline and track current and emerging network stability issues. Units will be supplied and installed by Alliance partners (Areva, Siemens and ABB) at agreed strategic points on National Grid, SP, SSE, NIE and ESBI transmission networks. The data will be

collected for research purposes and validated against systems models. The work will support the development of next generation data and communications infrastructures for smart applications.

To evaluate the functionality and performance of IEC61850 process bus based architecture for substation secondary systems.

To improve existing power oscillation detection and give additional oscillation source location information to enable the transmission network to be operated securely at high utilisation. Additional knowledge on windfarm related oscillations.

Project Eligibility Assessment Part 1

There are slightly differing requirements for RIIO-1 and RIIO-2 NIA projects. This is noted in each case, with the requirement numbers listed for both where they differ (shown as RIIO-2 / RIIO-1).

Requirement 1

Facilitate the energy system transition and/or benefit consumers in vulnerable situations (Please complete sections 3.1.1 and 3.1.2 for RIIO-2 projects only)

Please answer **at least one** of the following:

How the Project has the potential to facilitate the energy system transition:

n/a

How the Project has potential to benefit consumer in vulnerable situations:

n/a

Requirement 2 / 2b

Has the potential to deliver net benefits to consumers

Project must have the potential to deliver a Solution that delivers a net benefit to consumers of the Gas Transporter and/or Electricity Transmission or Electricity Distribution licensee, as the context requires. This could include delivering a Solution at a lower cost than the most efficient Method currently in use on the GB Gas Transportation System, the Gas Transporter's and/or Electricity Transmission or Electricity Distribution licensee's network, or wider benefits, such as social or environmental.

Please provide an estimate of the saving if the Problem is solved (RIIO-1 projects only)

n/a

Please provide a calculation of the expected benefits the Solution

n/a

Please provide an estimate of how replicable the Method is across GB

n/a

Please provide an outline of the costs of rolling out the Method across GB.

n/a

Requirement 3 / 1

Involve Research, Development or Demonstration

A RIIO-1 NIA Project must have the potential to have a Direct Impact on a Network Licensee's network or the operations of the System Operator and involve the Research, Development, or Demonstration of at least one of the following (please tick which applies):

- A specific piece of new (i.e. unproven in GB, or where a method has been trialled outside GB the Network Licensee must justify repeating it as part of a project) equipment (including control and communications system software).
- A specific novel arrangement or application of existing licensee equipment (including control and/or communications systems and/or software)
- A specific novel operational practice directly related to the operation of the Network Licensees system
- A specific novel commercial arrangement

RIIO-2 Projects

- A specific piece of new equipment (including monitoring, control and communications systems and software)
- A specific piece of new technology (including analysis and modelling systems or software), in relation to which the Method is

unproven

- A new methodology (including the identification of specific new procedures or techniques used to identify, select, process, and analyse information)
- A specific novel arrangement or application of existing gas transportation, electricity transmission or electricity distribution equipment, technology or methodology
- A specific novel operational practice directly related to the operation of the GB Gas Transportation System, electricity transmission or electricity distribution
- A specific novel commercial arrangement

Specific Requirements 4 / 2a

Please explain how the learning that will be generated could be used by the relevant Network Licensees

n/a

Or, please describe what specific challenge identified in the Network Licensee's innovation strategy that is being addressed by the project (RIIO-1 only)

n/a

- Has the Potential to Develop Learning That Can be Applied by all Relevant Network Licensees

Is the default IPR position being applied?

- Yes

Please demonstrate how the learning from the project can be successfully disseminated to Network Licensees and other interested parties.

Please describe how many potential constraints or costs caused, or resulting from the imposed IPR arrangements.<

Please justify why the proposed IPR arrangements provide value for money for customers.

Project Eligibility Assessment Part 2

Not lead to unnecessary duplication

A Project must not lead to unnecessary duplication of any other Project, including but not limited to IFI, LCNF, NIA, NIC or SIF projects already registered, being carried out or completed.

Please demonstrate below that no unnecessary duplication will occur as a result of the Project.

n/a

If applicable, justify why you are undertaking a Project similar to those being carried out by any other Network Licensees.

n/a

Additional Governance And Document Upload

Please identify why the project is innovative and has not been tried before

n/a

Relevant Foreground IPR

n/a

Data Access Details

n/a

Please identify why the Network Licensees will not fund the project as apart of it's business and usual activities

n/a

Please identify why the project can only be undertaken with the support of the NIA, including reference to the specific risks(e.g. commercial, technical, operational or regulatory) associated with the project

n/a

This project has been approved by a senior member of staff

Yes
