Notes on Completion: Please refer to the appropriate NIA Governance Document to assist in the completion of this form. The full completed submission should not exceed 6 pages in total.

NIA Project Registration and PEA Document

Date of Submission

Apr 2013

Project Reference Number

Project Registration

Project Title

Smart Asset Management - Energy Harvesting Technology for Self-Powering Condition Monitoring Sensors

Project Reference Number

Project Licensee(s)

National Grid Electricity Transmission

Project Start

February 2009

Project Duration

0 years and 2 months

Nominated Project Contact(s)

National Grid TO Innovation Team

Project Budget

£135,000.00

Summary

This project addresses the area of substation data collection systems required for operational and condition monitoring over short range communication links.

Self powered sensors are required for the deployment of plant and system monitoring functions at remote substation locations. These sensors could simply and efficiently collect data from difficult locations where the value of the data collected does not justify the provisioning of permanent data and power cabling.

The project supports other research and initiatives in energy storage and wireless substation communications to provide an easy to install and low maintenance data collection solution.

Problem Being Solved

Method(s)

Scope

Objective(s)

The project has the following aims and objectives:

- The aim is to develop the power supply technology for energy harvesting for selfpowering condition monitoring sensors.
- Investigate and develop energy harvesting devices based on capacitive / inductive coupling with the electromagnetic fields present

in electricity transmission substations.

- Intention is to produce a generic device capable of powering substation light current equipment such as active sensors that monitor the status, health and condition of electrical plant.

- Most likely uses of such power is to enable short-distance wireless data transfer to enable monitoring of a wide range of parameters using safe, low-cost, unobtrusive devices.

Condition monitoring and asset management processes are increasingly capable of being automated through intelligent software. Consequently, it is increasingly necessary to obtain data from more diverse and larger numbers of sensors than has previously been the case. To power those sensors, traditionally DC power supply from substation battery systems has to be connected via cross-site-cables, which often involve significant engineering work, also introduce additional risk of electromagnetic interference.

Therefore, installation and maintenance of these sensors must involve the minimum of labour, and removing the need for cables and batteries is a key aspect of “fit and forget” functionality. It is likely that the eventual cost of the sensors (once integrated) will become so low that they become effectively disposable. Robust monitoring will be further bolstered if the sensors are cheap enough to install with a level of redundancy for extra security.

Project Eligibility Assessment Part 1

There are slightly differing requirements for RIIO-1 and RIIO-2 NIA projects. This is noted in each case, with the requirement numbers listed for both where they differ (shown as RIIO-2 / RIIO-1).

Requirement 1

Facilitate the energy system transition and/or benefit consumers in vulnerable situations (Please complete sections 3.1.1 and 3.1.2 for RIIO-2 projects only)

Please answer **at least one** of the following:

How the Project has the potential to facilitate the energy system transition:

n/a

How the Project has potential to benefit consumer in vulnerable situations:

n/a

Requirement 2 / 2b

Has the potential to deliver net benefits to consumers

Project must have the potential to deliver a Solution that delivers a net benefit to consumers of the Gas Transporter and/or Electricity Transmission or Electricity Distribution licensee, as the context requires. This could include delivering a Solution at a lower cost than the most efficient Method currently in use on the GB Gas Transportation System, the Gas Transporter's and/or Electricity Transmission or Electricity Distribution licensee's network, or wider benefits, such as social or environmental.

Please provide an estimate of the saving if the Problem is solved (RIIO-1 projects only)

n/a

Please provide a calculation of the expected benefits the Solution

n/a

Please provide an estimate of how replicable the Method is across GB

n/a

Please provide an outline of the costs of rolling out the Method across GB.

n/a

Requirement 3 / 1

Involve Research, Development or Demonstration

A RIIO-1 NIA Project must have the potential to have a Direct Impact on a Network Licensee's network or the operations of the System Operator and involve the Research, Development, or Demonstration of at least one of the following (please tick which applies):

☐ A specific piece of new (i.e. unproven in GB, or where a method has been trialled outside GB the Network Licensee must justify repeating it as part of a project) equipment (including control and communications system software).

☐ A specific novel arrangement or application of existing licensee equipment (including control and/or communications systems and/or software)

☐ A specific novel operational practice directly related to the operation of the Network Licensees system

☐ A specific novel commercial arrangement

RIIO-2 Projects

☐ A specific piece of new equipment (including monitoring, control and communications systems and software)

☐ A specific piece of new technology (including analysis and modelling systems or software), in relation to which the Method is

unproven

☐ A new methodology (including the identification of specific new procedures or techniques used to identify, select, process, and analyse information)

☐ A specific novel arrangement or application of existing gas transportation, electricity transmission or electricity distribution equipment, technology or methodology

☐ A specific novel operational practice directly related to the operation of the GB Gas Transportation System, electricity transmission or electricity distribution

☐ A specific novel commercial arrangement

Specific Requirements 4 / 2a

Please explain how the learning that will be generated could be used by the relevant Network Licensees

n/a

Or, please describe what specific challenge identified in the Network Licensee's innovation strategy that is being addressed by the project (RIIO-1 only)

n/a

☐ Has the Potential to Develop Learning That Can be Applied by all Relevant Network Licensees

Is the default IPR position being applied?

☐ Yes

Please demonstrate how the learning from the project can be successfully disseminated to Network Licensees and other interested parties.

Please describe how many potential constraints or costs caused, or resulting from the imposed IPR arrangements.<

Please justify why the proposed IPR arrangements provide value for money for customers.

Project Eligibility Assessment Part 2

Not lead to unnecessary duplication

A Project must not lead to unnecessary duplication of any other Project, including but not limited to IFI, LCNF, NIA, NIC or SIF projects already registered, being carried out or completed.

Please demonstrate below that no unnecessary duplication will occur as a result of the Project.

n/a

If applicable, justify why you are undertaking a Project similar to those being carried out by any other Network Licensees.

n/a

Additional Governance And Document Upload

Please identify why the project is innovative and has not been tried before

n/a

Relevant Foreground IPR

n/a

Data Access Details

n/a

Please identify why the Network Licensees will not fund the project as apart of it's business and usual activities

n/a

Please identify why the project can only be undertaken with the support of the NIA, including reference to the specific risks(e.g. commercial, technical, operational or regulatory) associated with the project

n/a

This project has been approved by a senior member of staff

☑ Yes
